

WANG MODEL 703 PAPER TAPE EDITOR

The Model 703 Paper Tape Editor, a peripheral unit to the 700 Series Programmable Calculator, provides off-line punched paper tape users with a convenient and economical means for obtaining calculated output from their raw data.

Independent of other computing facilities, numerical data generated by any instrument with paper tape output can be processed. A fully-formatted hard copy output can be generated automatically if a Model 701 Output Writer is used with the calculator.

SPECIFICATIONS

Tape Code: Standard 8-level ASCII Code*

Reading Speed: 25 characters/second (approx.)

Type of Reader: Mechanical

Recognition: Numeric (0 through 9), sign and decimal. Maximum of 12 digits

Power Requirement: 115 VAC, 60 Hz

Switches: Power On/Off

Interconnection: Permanently attached 703 cable connects to calculator's I/O connector

Calculator Compatibility: 700A, 700B, 720A, 720B

ADDRESSING

A two-step command from the calculator, either initiated from the keyboard or by program control, transfers operation to the Model 703. Data from the punched tape is entered into the X register of

the calculator. A non-numeric code from the tape generates a "GO" command to the program, returning the control to the calculator.

Read Data Command. This command directs the Model 703 to ignore all codes until a numeric code is encountered. All numeric codes including decimal point and algebraic sign are transmitted to the keyboard until a non-numeric code is encountered. The Model 703 will then stop reading and execute a "GO" command transferring control back to the keyboard, core memory or peripheral device which originally transmitted the command.

Example

Program Instruction from Keyboard or Core	Program Code
GROUP 1	0409
0000	0000

Tape Alignment Command. This command directs the Model 703 to ignore all codes until a carriage return (ASCII) code is encountered on the tape. The Model 703 will then automatically stop and await a read data command (see previous paragraph) to read the first set of data.

Example:

Program Instruction from Keyboard or Core	Program Code
GROUP 1	0409
0007	0007

Rub-out Commands. When four or more consecutive rub-out (ASCII) codes appear on the tape, the Model 703 will recognize the command as an "end-of-tape" and then stop. This condition will generate a "search and return" 0000 command to the calculator. Consecutive rub-out commands of less than four will always be ignored.

COMPATIBILITY

Other peripheral equipment can be inter-connected to the parallel I/O bus line connector on the rear of the Model 703.

*Compatibility with other codes may be available upon special request.
